Shed Shackle Specification

ShedShackle-80mm-Trade
ShedShackle-80mm-Retail

The Shed Shackle is Sold Secure Domestic Silver and Police Secured-by-Design approved for use as a wall-mounted anchoring point for cycles etc. inside wooden sheds. It is SBD *New Homes* compliant.

Overall Length of the installed unit: 1200mm.
It is supplied with a RAL 3020 Red powder coated finish.
80mm long bolts are supplied as standard, suiting timber thicknesses up to 60mm (including cladding). Alternative bolt lengths are available.

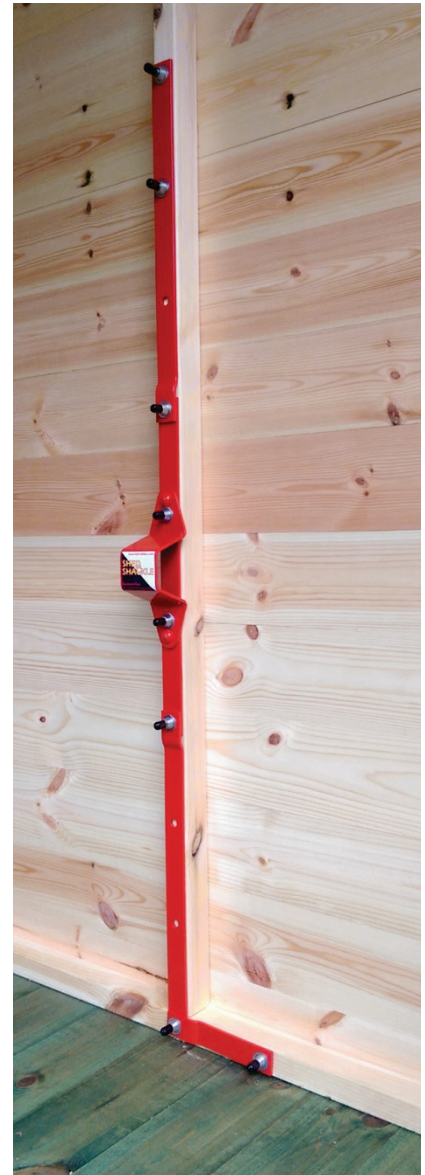

It is usually fitted on-site, after erection of the shed, taking approximately 20 minutes per unit for any carpenter, fitter or other competent tradesperson. A *Fitting Overview* is included inside each normal 'Trade' pack. (The alternative 'Retail' pack also includes an 8.0mm HSS drill bit plus more comprehensive DIY-oriented fitting instructions.) A 16mm AF spanner or socket or an adjustable wrench, plus an electric drill and an 8.0mm HSS drill bit are required to fit. All fixings are normally included in the pack, comprising: M8 coach bolts, M8 shear nuts and plastic caps (qty. 8 of each).

The photograph to the right shows the typical fitting configuration for a wooden shed with no window. Coach bolt holes are drilled *from the inside* and the bolts inserted *from the outside* of the shed.

It is typically fitted with the Shackle itself on a vertical member of the shed frame, with an extension bar above and another below, and the shorter side brace fitted perpendicularly to the lower extension bar on a timber at floor level. You can modify this if you want to fit the parts in different orientations. It is important that the bars are all fitted to structural members and the side brace is perpendicular to the other bars. Access to the outside of the shed wall is required.

Bulk quantities of e.g. 60 units are normally supplied on a Euro pallet. Smaller quantities can be supplied in cartons holding up to 10 units and delivered by courier.
